

INFRASTRUCTURE AND LOGISTICS DEVELOPMENTS

Infrastructure is not just about money.
It is about movement
and confidence.

From freight rail and port capacity to roads energy and strategic logistics corridors, South Africa's infrastructure system is being reshaped to support growth, trade and long-term competitiveness. The latest developments show how public investment and reform are helping build a stronger foundation for national delivery.

Infrastructure and logistics are among the most important drivers of South Africa's competitiveness. When electricity is stable, ports are efficient, roads are maintained and rail corridors operate reliably, businesses can move goods faster, communities can access services more easily and the economy becomes more attractive to investors.

In the transport sector, the government has placed strong emphasis on unlocking freight and export capacity. Recent reforms in rail and ports are designed to move more freight from road to rail, reduce congestion, improve port handling performance and support industries that rely on export routes. The opening of the rail network to private train operating companies is intended to add freight capacity and help South African producers move minerals, vehicles, agricultural products and other goods to local and international markets.

The Durban Container Terminal Pier 2 concession has reached financial close and is expected to increase handling capacity from 2 million to 2.8 million TEUs per year. Government has described this as a bankable model for future public-private partnerships, with further private-sector participation projects expected in the Ngqura Manganese Export Corridor, Richards Bay

KEY DEVELOPMENTS AT A GLANCE

PORT CAPACITY GROWTH

2.0M to 2.8M

TEUs per year
Durban Container Terminal
